Bitcoin and Ethereum prices tracked closely across all five major exchanges (Binance, Bybit, OKX, Bitget, Gate), with tight spreads showing good liquidity. Binance led volume decisively: Bitcoin $5.5 billion and Ethereum $4.8 billion USD.

02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 23:00 UTC), not daily figures.

Traders remained very bullish despite the price decline. On Binance, long positions outnumbered shorts by 2.2:1 for Bitcoin and 3.4:1 for Ethereum. The largest traders (top-position ratio) showed even stronger bullish bias at 1.7:1 on both. Funding rates stayed elevated at 10.95% annually for Bitcoin and 9.95% for Ethereum, meaning longs paid shorts premium. Open interest fell 2.4% for Bitcoin but held nearly flat for Ethereum, hinting at modest liquidations. Taker buy/sell ratios below 1.0 (0.96 for Bitcoin, 0.91 for Ethereum) revealed more aggressive selling by market-takers than buying. Market breadth was negative: only 45.7% of Binance perpetuals rose on the day.

07 · GLOSSARY

Every term used today, in plain words

Annualized funding rate — The yearly return that long-position holders pay to short-position holders (or vice versa) in perpetual futures, expressed as a percentage. High rates (above 10%) suggest longs are overconfident and paying a premium. 8-hour rates are multiplied by ~3 to annualize.

Breadth (market breadth) — The percentage of all instruments (cryptocurrencies or futures) that rose on the day. Below 50% indicates more losers than winners (bearish signal); above 50% indicates more winners (bullish signal). Binance breadth was 45.68% on October 25, showing slightly more losers.

Funding rate — A periodic payment between long and short traders in perpetual futures. If positive, longs pay shorts; if negative, shorts pay longs. Reflects market sentiment (high positive rates = consensus is bullish).

Liquidations — Forced closeout of leveraged positions when losses exceed a trader's margin. Large liquidations cause price spikes and can trigger cascading losses.

Long position / Long — A bet that price will rise. A long-position holder profits if the price goes up and loses if it goes down.

Long/short ratio — The ratio of long-position accounts to short-position accounts (e.g., 2.2:1 means 2.2 longs for every 1 short). Above 1.0 = bullish bias; below 1.0 = bearish bias.

Mark price — The settlement price used in perpetual futures, usually based on an index of spot prices across exchanges. Used to calculate unrealized gains/losses and trigger liquidations.

Open interest (OI) — The total number of open positions (long and short combined) in a futures market, expressed in coins or USD. Rising OI suggests new money entering; falling OI suggests positions are closing.

Open-interest change — The daily percentage change in total open interest. Negative change = positions closing (bearish signal); positive = new positions opening (bullish signal).

Short position / Short — A bet that price will fall. A short-position holder profits if the price goes down and loses if it goes up.

Taker buy/sell ratio — The ratio of market-buy orders (takers buying at the ask) to market-sell orders (takers selling at the bid). Above 1.0 = more aggressive buying; below 1.0 = more aggressive selling. October 25 showed 0.96 for Bitcoin and 0.91 for Ethereum, both indicating more aggressive selling.

Top-trader long/short ratio (top-position ratio) — The long/short ratio among the largest and most experienced traders on an exchange, not all accounts. High values (e.g., 1.7:1) indicate large traders are very bullish.
