02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Gate	+7.6%	\$2.12B	—	—	—	—	\$2,685.01

Funding, open interest and mark price are point-in-time (as of 22:53 UTC), not daily figures.

Funding rates were elevated at 1.79% to 10.95% annualized, showing traders were paying to hold long positions. Bitcoin had slightly more long positions than short (long/short ratio 1.17), but Ethereum showed strong long bias (2.76), especially among the largest traders. Taker buy/sell ratios below 1 (0.97 for Bitcoin, 0.94 for Ethereum) indicated more aggressive selling than buying. Market breadth was very weak: only 15.64% of Binance perpetual contracts were up on the day.

Asian stocks fell sharply on Sept 28: South Korean semiconductor stocks led declines with SK Hynix down 4.74% and Samsung Electronics down 3.85%. Hong Kong also saw weakness, with MiniMax down 10.40% and Zhongji Innolight down 10.21%. US markets were also down (S&P 500 -0.74%, Nasdaq -0.92%). The broad selloff in semiconductors and tech suggests supply-chain or earnings concerns rippled through traditional markets.

— 07 · GLOSSARY

Every term used today, in plain words

Breadth (market breadth) — The percentage of all traded assets that went up versus down on the day. Low breadth (few assets up) signals weak overall market health, even if major assets fell less.

Funding rate — A fee paid between traders holding long and short positions in perpetual futures. High funding rates (when longs pay shorts) suggest overheated bullish sentiment.

Inflow / outflow (ETF flows) — The daily net amount of money entering (inflow) or leaving (outflow) exchange-traded funds. Positive inflow means buyers exceeded sellers; negative outflow means sellers exceeded buyers.

Long/short ratio — The proportion of traders holding long (bet on price up) versus short (bet on price down) positions. Ratios above 1.0 mean more longs than shorts; below 1.0 means more shorts than longs.

Mark price — The reference price used to settle derivatives (futures) contracts, usually a weighted average of spot prices across major exchanges to prevent manipulation.

Open interest (OI) — The total value of all outstanding leveraged positions (longs and shorts combined) in futures contracts. Rising OI means new money is entering leveraged trading; falling OI means traders are closing positions.

Spot ETF — A regulated investment fund that holds actual Bitcoin or Ethereum (not derivatives). Investors buy shares instead of coins directly, gaining exposure via traditional brokers.

Taker buy/sell ratio — The proportion of trades initiated by buyers (aggressive) versus sellers (aggressive). Above 1.0 means more aggressive buying; below 1.0 means more aggressive selling.

Top position ratio (top-trader long/short) — The long/short ratio among the largest traders on an exchange, showing whether the most powerful accounts are net long or net short. Used to spot 'smart money' positioning.
