All five major exchanges (Binance, Bybit, OKX, Bitget, Gate) showed agreement on Bitcoin pricing near \$84,875. Binance led volume with \$12.0 billion in daily BTC trading, followed by OKX's \$6.9 billion; ETH volume concentrated similarly at Binance (\$8.6 billion) and OKX (\$6.3 billion).

02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 02:00 UTC), not daily figures.

Bitcoin showed positive funding (2.0% annualized on Binance), indicating traders expected prices to rise. Open interest grew 3.1% on Binance—more money betting Bitcoin's direction. Long positions (bets on price up) outnumbered shorts (bets on price down) by 1.35 times among regular traders, but the largest traders were far more bullish at 2.09 times. Ethereum had stronger funding (5.4% annualized) and a more extreme long-short imbalance at 2.71 times for regular traders, 1.67 times for the largest traders. Overall selling pressure was slightly stronger: both Bitcoin and Ethereum saw taker buy/sell ratios slightly below 1.0 (Bitcoin 0.983, Ethereum 0.977), meaning aggressive sellers just barely outnumbered aggressive buyers. Market breadth remained positive with 53% of Binance perps trading higher on the day.

THE THREE THAT MATTERED MOST

SEC proposes new framework allowing investment advisers and funds to self-custody crypto

The US Securities and Exchange Commission announced a proposal on Thursday that would permit investment advisers and regulated funds to hold crypto assets in self-custody under certain conditions, or use state trust companies as custodians. The 60-day public comment period opens immediately. This replaces the 2023 Safeguarding Rule proposal, which the SEC had withdrawn in 2025 after criticism.

Every term used today, in plain words

Basis — The difference between the spot price of an asset (what you pay right now) and its futures price (what you pay for future delivery). A positive basis means futures trade higher than spot.

Breadth — The percentage of cryptocurrencies in the market that traded higher versus lower on a given day; 53% breadth means more coins went up than down.

ETF flows (inflows/outflows) — The daily net buying or selling of shares in exchange-traded funds (ETFs). Positive flows (inflows) mean investors bought more shares than they sold; negative flows (outflows) mean the opposite.

Funding rate — A payment that traders holding long positions (betting price up) pay to traders holding short positions (betting price down), or vice versa. Positive rates encourage buying; negative rates encourage selling. Rates are typically charged or paid every 8 hours on major exchanges.

Long position — A bet that the price of an asset will go up.

Long/short ratio — The number of traders betting the price will go up (long) divided by the number betting it will go down (short). A ratio above 1.0 means more traders are betting on up; below 1.0 means more are betting on down.

Mark price — The official price used to calculate profits and losses on a perpetual futures contract, typically calculated as a weighted average of recent trades across exchanges to prevent manipulation.

Open interest — The total number of unclosed contracts (either long or short) in a futures market at a given moment. Growing open interest means more money is entering the market; shrinking open interest means traders are closing positions.

Open-interest change — The percentage increase or decrease in total open interest over a given period (usually one day). A 3% increase means \$3 in new open interest arrived for every \$100 that existed before.

Perpetual futures (perps) — A futures contract with no expiration date, designed to track the spot price of an asset (like Bitcoin) using funding rates to keep the two prices in sync. Traders use leverage (borrowing) to amplify gains or losses.

Short position — A bet that the price of an asset will go down.

Spot price — The actual price of an asset right now in the physical market, as opposed to futures prices (which are for future delivery).

Taker buy/sell ratio — The ratio of aggressive buy orders (takers) to aggressive sell orders (takers) on an exchange. Above 1.0 means more buying pressure; below 1.0 means more selling pressure.

Top-position ratio — The long-to-short ratio among only the largest traders in the market, rather than all traders. Useful for tracking smart money positioning.

Volume — The total dollar value (or number of coins) traded in a given period; higher volume suggests more activity and typically higher confidence in price moves.
