02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way.

BITCOIN

VENUE	FUNDING (ANN.)	OPEN INTEREST	OI CHANGE	LONG/SHORT	MARK
OKX	+8.5%	\$2.49B	—	1.15	\$84,392.30

Gate	+4.7%	\$2.93B	—	—	\$2,687.47

Funding, open interest and mark price are point-in-time (as of 03:02 UTC), not daily figures.

Traders paid positive interest (4–10.95% annualized) betting on price gains, but open interest shrank 2–9.6% as positions closed. Long-to-short ratios stayed bullish (Bitcoin 1.16:1 on Binance, Ethereum 2.78:1), yet liquidations hit \$280 million in Bitcoin longs as the price break below \$84,000 squeezed leveraged bulls.

07 · GLOSSARY

Every term used today, in plain words

Basis points — A unit equal to 1/100th of 1 percent. When the 10-year Treasury yield rose 18 basis points, it rose 0.18 percentage points (e.g., from 4.92% to 5.10%).

ETF (Exchange-Traded Fund) — A fund that trades on an exchange like a stock. Bitcoin and Ethereum spot ETFs track the price of those coins and let investors buy exposure without owning the actual coins.

ETF inflow / outflow — Inflow = net buying into an ETF; outflow = net selling. Positive inflow means more people bought than sold; negative outflow means more sold than bought.

Funding rate — Interest paid by traders betting on price increases to traders betting on price decreases, or vice versa. Positive funding means bulls are paying bears, signaling strong bullish sentiment. Paid every 8 hours on major exchanges.

Liquidation — Forced automatic sale of a leveraged position when the price moves against it and the margin runs out.
Example: a trader who borrowed money to bet on Bitcoin rising gets forced to sell if the price falls too fast.

Long / long position — A bet that the price will go up.
Opposite of short (a bet that price will go down).

Long-to-short ratio — The ratio of bullish (long) positions to bearish (short) positions. A ratio of 1.16:1 means 16% more bullish bets than bearish ones.

Mark price — The price used to calculate gains/losses and margin requirements on futures and perpetuals. It tracks the spot price closely to prevent manipulation.

Open interest — The total number of open (unsettled) contracts on an exchange. When open interest falls, it means positions are being closed; when it rises, new positions are being opened.

Open-interest change — The day's percentage gain or loss in total open positions. Negative change (e.g., -9.6%) means traders closed positions net; positive change means they opened them.

Perpetual (perp) / futures — Contracts that let traders bet on price movements without owning the underlying coin. Perpetuals never expire; futures expire on a set date. Both use leverage (borrowed money).

PMI (Purchasing Managers Index) — A survey-based measure of business activity in manufacturing and services. Readings above 50 signal expansion; 58.7 (services) is very strong and typically triggers fears of higher interest rates.

Treasury / 10-year Treasury — A loan you make to the US government; the 10-year version pays you interest for 10 years. The yield is the interest rate. When Treasury yields rise, it makes bonds attractive relative to riskier assets like Bitcoin.

Volume — The total dollar amount (or coin amount) traded in a given period. High volume = many trades; low volume = few trades. Helps measure how much activity an exchange or market had.
