Binance led volume with $13.6 billion in BTC perpetuals and $10.2 billion in ETH, with strong volume distribution across all major exchanges (Binance, Bybit, OKX, Bitget, Gate).

02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 00:00 UTC), not daily figures.

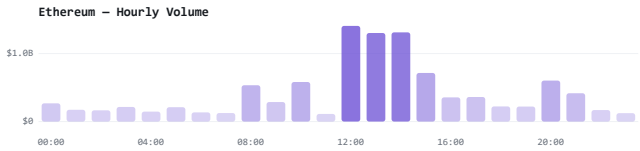

Bitcoin funding rates diverged: Binance went negative at −4.53% annualized (less bullish), while Bitget remained positive at +10.95% and OKX at +3.99%. Top-tier traders held a 1.52:1 long ratio while taker activity was slightly bearish at 0.996:1 (near parity), and overall account longs were 1.29:1. Open interest on Binance rose despite the price decline. Ethereum showed stronger conviction with top traders at 1.58:1 long and accounts at 2.66:1 long, though taker buying at 1.044:1 remained modest. Ethereum funding at 8.93% annualized could slow momentum. Market breadth was weak: only 12.9% of Binance perpetuals traded up on the day.

Asian semiconductor stocks suffered heavy losses on macro concerns. SK Hynix (KRX session) fell 9.99%, Samsung Electronics (KRX) fell 7.30%, and Hanmi fell 9.78%—driven by three factors: rising interest rates and higher financing costs threatening AI investment returns; Chinese DRAM competitor CXMT announcing mass production of next-generation memory chips; and Gartner data showing $7 trillion in projected AI infrastructure investment against only $3.6 trillion in data center revenue, raising impairment risk. US stocks also fell: the S&P 500 down 1.08%, Nasdaq down 1.83%. The US dollar strengthened 0.34% and gold rose 0.27% as a risk-off move.

What drove the market — and what didn't

Only causes that move prices, each with its source. Rumours and unconfirmed reports are kept separate at the end.

THE THREE THAT MATTERED MOST

Hot US inflation revives Fed rate-hike expectations, triggering crypto selloff

September 2026 US consumer inflation (CPI) came in at 3.7% on a headline basis and 2.6% for core prices year-over-year, both beating Wall Street forecasts. Energy prices, particularly gasoline up 9.1%, drove the monthly 0.6% increase. The hotter-than-expected print reignited expectations for another Federal Reserve interest rate hike before the October 27–28 policy meeting, sending Bitcoin below $82,000 and Ethereum down 3% as traders rotated away from crypto.

07 · GLOSSARY

Every term used today, in plain words

Basis — In this report, 'utc-day basis' means the price movement is measured over a full UTC calendar day (00:00–23:59 UTC).

Breadth (market breadth) — The percentage of all traded perpetual contracts that went up on the day. Low breadth (like 12.9%) means most coins fell; high breadth means a broad rally across the market.

Core CPI — Core inflation is the headline consumer price index minus energy and food prices, which tend to be volatile. Core inflation shows the underlying price trend.

Funding rate — A small payment that long traders (those betting price will rise) pay to short traders (those betting price will fall) every 8 hours on futures exchanges. Positive rates favor shorts; negative rates favor longs. Annualized rates show what the rate would be if kept constant for a year.

Headline CPI — The total change in consumer prices, including food and energy. It's often more volatile than core inflation but represents the full cost-of-living picture for ordinary people.

Long position / long — A bet that the price will rise. Long traders profit if the asset goes up; they lose if it goes down.

Long/short ratio — The number of traders betting the price will rise (longs) divided by the number betting it will fall (shorts). A ratio above 1.0 means more longs than shorts (bullish); below 1.0 means more shorts (bearish).

Mark price — The reference price used to calculate profit and loss on futures contracts, typically a blend of the spot price and funding-weighted futures prices. It prevents flash crashes from liquidating traders unfairly.

Open interest — The total amount of money (in USD) or coins tied up in open futures contracts on an exchange. Rising open interest with falling price can mean shorts are piling in; rising with rising price means long conviction.

Short position / short — A bet that the price will fall. Short traders profit if the asset goes down; they lose if it goes up.

Taker buy/sell ratio — The ratio of buying volume to selling volume among traders who take existing orders (takers). A ratio above 1.0 means more aggressive buying; below 1.0 means more aggressive selling.

Top-tier trader ratio — The long/short ratio specifically among the largest traders and whales on an exchange, not all accounts. It shows what the biggest players believe.
