Bitcoin and Ethereum prices aligned across all five major venues, with Bitcoin at $82,945 (up 0.43%) and Ethereum at $2,505 (up 0.74%), showing no meaningful price drift between exchanges. Volume was very strong across all venues: Binance alone saw $3.07 billion in Bitcoin volume and $2.37 billion in Ethereum volume.

02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 00:00 UTC), not daily figures.

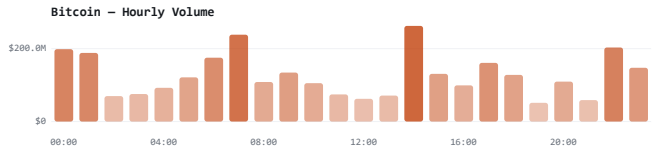

Bitcoin open interest grew slightly (up 0.51% to 92,586 coins), but funding rates split sharply by venue—negative at major houses (Binance at -2.98%), aggressively positive at Bybit (+10.95%)—signaling disagreement on whether the rally will hold. Long positions outnumbered shorts by 1.48-to-1 on the broad market (1.61-to-1 among top traders), meaning larger traders were even more bullish. Ethereum showed much heavier long lean (3.00-to-1 broad, 1.75-to-1 top traders), with open interest up 0.68% despite deep negative funding at Binance (-12.87%), suggesting the longs were expensive to hold. Taker buy/sell ratio was 1.07 for Bitcoin and 1.04 for Ethereum, showing slightly more aggressive buying than selling. Market breadth was strong at 66.79% of Binance perpetuals up on the day.

THE THREE THAT MATTERED MOST

Bitcoin ETFs return to inflows; Ethereum ETFs extend nine-day outflow streak

US spot Bitcoin ETFs attracted $21.13 million in inflows on October 9, marking a recovery after last week's $681 million outflow. In sharp contrast, Ethereum ETFs shed $542.1 million last week—their worst week since January—extending losses for nine straight trading days. BlackRock's ETHA fund alone lost $477 million, accounting for 88% of the category's total outflows. The divergence highlights investor preference for Bitcoin over Ethereum heading into the last quarter.

Starknet explores Layer 1 transition and quantum-resistant upgrade, driving 41% token surge

Starknet CEO Eli Ben-Sasson hinted that the team is considering moving Starknet off Ethereum to operate as an independent Layer 1 blockchain. The core motivation is quantum resistance—Starknet's proof system uses hash functions that are inherently more resistant to quantum computer attacks than other methods. The announcement drove STRK to a 41% single-day gain, with the token gaining over 73% in the past week.

CFTC proposes classifying prediction market contracts as regulated swaps, seeking to assert oversight

The US Commodity Futures Trading Commission (CFTC) proposed on October 9 to classify event contracts on platforms like Polymarket and Kalshi as 'swaps' under federal regulation, requiring those platforms to comply with stricter derivatives rules. The proposal includes a 30-day comment period and a separate interim rule to exclude casino-style gambling. Event contracts on sports have reportedly accounted for over 85% of trading volume on Kalshi, making this regulatory clarity significant for the prediction market industry.

XRP Ledger patches decade-old bug that could have created billions in counterfeit XRP

Researchers discovered and reported a flaw dating to 2015 in the XRP Ledger's built-in exchange that could have allowed attackers to create and spend new XRP, violating the cryptocurrency's fixed 100-billion-coin supply cap. The vulnerability was fixed in xrpld 3.4.1 released September 25, with public disclosure on October 9–10. RippleX found no evidence the flaw was exploited on any public network.

CONTEXT: October 10, 2025 flash crash anniversary—one year later, Bitcoin has reclaimed some ground but liquidity concerns persist

Saturday marked the one-year anniversary of October 10, 2025, when a Trump tariff announcement triggered a $19 billion liquidation cascade in crypto futures, wiping out 1.6 million long positions in minutes. Bitcoin had fallen from ~$122,000 to ~$105,000 in hours. One year on, Bitcoin sits near $82,945—about one-third below the pre-crash all-time high—and analysts note that while order books have deepened for Bitcoin and Ethereum, systemic risks from leveraged trading and crowded bets remain.

07 · GLOSSARY

CS Gorkem T
CS Tarik O

Every term used today, in plain words

Basis — The difference between the price of a futures contract and the underlying spot price. Can indicate whether traders are bullish (positive basis) or bearish (negative basis).

Funding rate — The interest rate that long-position holders pay to short-position holders (or vice versa) in perpetual futures contracts. Positive rates mean longs are paying shorts; this happens when longs outnumber shorts and traders expect higher prices. Negative rates mean shorts are paying longs.

Liquidation — When a trader's losses in a leveraged position grow so large that the exchange automatically closes the position to prevent further losses. Can trigger a cascade of forced selling if many traders are liquidated at once.

Long/short ratio — The number of open long contracts divided by the number of open short contracts on a derivatives exchange. A ratio above 1.0 means more longs than shorts, suggesting traders expect prices to rise; below 1.0 means more shorts than longs.

Mark price — The reference price used by derivatives exchanges to calculate trader profits and losses on perpetual futures. Different from the last traded price and designed to prevent extreme swings due to low liquidity.

Market breadth — The percentage of trading pairs (or coins) that rose on a given day. Higher breadth (e.g., 66%) means most cryptocurrencies are up, suggesting broad-based strength; lower breadth means weakness is widespread.

Open interest — The total number of unfilled long and short contracts in derivatives markets. Growing open interest suggests new money entering; shrinking open interest suggests exits or liquidations.

Perpetual futures — Leveraged crypto derivatives contracts with no expiration date. Traders can hold them indefinitely as long as they maintain collateral, and funding rates keep long and short prices aligned with the spot market.

Taker buy/sell ratio — The ratio of aggressive buy orders to aggressive sell orders. Above 1.0 means more people are buying aggressively (pushing price up); below 1.0 means more aggressive selling (pushing price down).
