THE DAY IN ONE LINE

Bitcoin and Ethereum both fell under 2% on September 13 as traders remained bullish on funding rates, with a bridge-security recovery highlighting DeFi vulnerabilities.

— 01 · PRICE & VOLUME

What every venue's price and volume did

The same two contracts on every exchange, for this UTC day. When the prices line up, nothing unusual is happening; a gap or a big volume difference is worth noticing.

BITCOIN (BTC PERPETUAL)

Bitget	\$2,475.9	-1.94%	\$2,526.91	\$2,460.2	\$1.38B
Gate	\$2,475.78	-1.94%	\$2,526.82	\$2,460.84	\$3.52B

Bitcoin stayed consistent around \$77,700 across all five major exchanges, down 0.57% for the day. Ethereum hovered near \$2,510, down 1.95%. Trading volume held steady and strong across Binance, Bybit, OKX, Bitget, and Gate.io—no single exchange dominated.

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way.

Bitget	+11.0%	\$1.98B	—	—	\$2,511.15
Gate	+11.0%	\$3.13B	—	—	\$2,510.92

Funding, open interest and mark price are point-in-time (as of 11:35 UTC), not daily figures.

Traders showed bullish sentiment: funding rates (the cost to hold bets on higher prices) remained positive across all venues at 4.9% to 9.7% annualized, indicating traders were willing to pay to maintain upside bets. Bitcoin open interest rose modestly (0.2–1.0%), showing traders adding positions. Ethereum open interest fell (0.3–1.6%), with some traders closing bets. Long positions (bets on up) outnumbered short positions (bets on down) across most venues.

THE THREE THAT MATTERED MOST

Symbiosis recovers 15 BTC after bridge exploit

On September 13, the Symbiosis protocol announced recovery of approximately 15 BTC following a September 11 exploit. An attacker had minted 46.1 billion counterfeit syBTC tokens and initially drained liquidity. While the protocol team secured 15 BTC in a multisig wallet, the attacker had already converted ~4.39 WBTC through Uniswap v4, realizing roughly \$336,000. Symbiosis offered a 20% bounty if the attacker returned remaining assets; the native Bitcoin Bridge remained paused as the team completed asset accounting.

Federal Reserve rate decision Wednesday, September 16 (context)

The Federal Reserve will announce its interest rate decision on Wednesday, September 16 at 18:00 UTC (2 PM US Eastern Time), with a press conference at 18:30 UTC. Markets are pricing in a possible rate hike—the first since 2023—though recent inflation data has softened. The decision could create significant volatility across crypto and traditional markets.

CLARITY Act Senate procedural vote September 15 (context)

The crypto industry's CLARITY Act faces a procedural Senate cloture vote on September 15 to determine whether debate can proceed. Republicans control 53 seats; 60 votes are needed (requiring 7 Democratic votes). Passage would establish comprehensive market-structure rules for crypto assets. Market consensus sees the vote as uncertain, with passage a moderate-probability event by industry observers.

— 07 · GLOSSARY

Every term used today, in plain words

Annualized percentage — A rate expressed as if it were applied for a full year. If a funding rate is 0.0000509 per 8 hours and annualized, it equals roughly 5.6% per year.

Basis — The time period used to calculate price changes and volume. 'UTC-day' means 00:00–23:59 UTC on a given date; 'rolling-24h' means the most recent 24 hours from the reporting time.

Funding rate — A periodic fee exchanged between traders on derivatives exchanges. When funding is positive, traders betting on higher prices pay traders betting on lower prices to hold their positions. Higher positive funding suggests bullish sentiment (more demand to go long). Funding rates reset every 8 hours on most major exchanges.

Long position — A bet that an asset's price will rise. A trader holding a long Bitcoin position profits if Bitcoin's price increases.

Long/short ratio — The proportion of traders betting prices will go up versus down at a given time. A ratio of 1.5 means 1.5 traders are long for every 1 trader short. Higher ratios indicate more bullish sentiment.

Mark price — The reference price used by an exchange to calculate trader profits and losses on futures contracts. It is typically a blend of recent trades, an index price, and the underlying spot price, designed to prevent manipulation.

Multisig wallet — A cryptocurrency wallet controlled by multiple private keys, typically held by different parties. Transactions require approval from a threshold number of those keys (e.g., 3 of 5), making theft more difficult.

Open interest — The total dollar value (or coin quantity) of all open long and short contracts on a futures exchange. Rising open interest suggests traders are adding new positions; falling open interest suggests traders are closing existing positions.

Open-interest change — The percentage increase or decrease in total open positions over a reporting period. A +1% change means traders added new bets equal to 1% of the previous total open interest.

Short position — A bet that an asset's price will fall. A trader holding a short Bitcoin position profits if Bitcoin's price decreases.

Volume — The total dollar value of trades (buys and sells combined) executed during a period. Higher volume typically indicates more active trading and liquidity.
