02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 01:00 UTC), not daily figures.

Funding rates on both Bitcoin and Ethereum remained positive at around 6-7% annualized, indicating longs are paying shorts. Bitcoin's open interest rose 3.1% and Ethereum's by 1.5%, showing increased derivative trading activity. Large traders held more long positions than shorts on both assets, with top traders' long/short ratios of 1.93 for Bitcoin and 1.55 for Ethereum. Buying and selling pressure was roughly balanced, with 58% of altcoins trading higher on the day.

Bitget hackers move \$4 million into Zcash privacy pool, making funds harder to trace

About 15% of the Zcash stolen in the \$387.5 million Bitget breach has been moved into Zcash's Ironwood privacy pool, where transaction details are hidden from public view. This follows the attackers' failed attempts to swap funds through other protocols after those routes were blocked.

Every term used today, in plain words

Altcoin — Any cryptocurrency other than Bitcoin. Ethereum, Dogecoin, Cardano, and thousands of others are altcoins.

Derivative or futures contract — An agreement to buy or sell an asset at a fixed price on a future date. Traders use these to bet on price direction without owning the underlying asset.

Funding rate — A payment between traders holding long (bullish) and short (bearish) positions on derivatives contracts. When funding is positive, longs pay shorts, signaling bullish sentiment. When negative, shorts pay longs, signaling bearish sentiment.

Long/short ratio — The proportion of traders holding bullish (long) positions versus bearish (short) positions. A ratio above 1 means more traders are bullish; below 1 means more are bearish.

Mark price — The reference price used to calculate profits and losses on derivative contracts. It is typically based on the index price rather than the last trade price, to prevent manipulation.

Market breadth — The percentage of coins or assets that are trading higher (up) versus lower (down) on a given day. Higher breadth (more coins up) is typically bullish; lower breadth is bearish.

Open interest — The total number of active derivative contracts (futures or perpetuals) that have not been closed. Increasing open interest often means more traders are entering the market; decreasing means traders are exiting.

Perpetual or perps — A type of derivative contract with no expiration date. Traders can hold perpetuals indefinitely as long as they maintain enough collateral.

Taker buy/sell ratio — A measure of aggressive buying versus selling pressure. Ratios above 1 indicate more aggressive buyers (bullish); below 1 indicate more aggressive sellers (bearish).

Top traders' long/short ratio — The long/short positioning of the largest traders on an exchange, as opposed to all traders. Useful for gauging what the biggest money is doing.
