02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 00:00 UTC), not daily figures.

Bitcoin funding turned slightly negative (−0.81% annualized), signaling more traders betting on price declines, but the long/short ratio of 1.09 showed more buyers than sellers overall. Top traders stayed heavily long at 1.78×, while regular buyers (taker ratio 0.96) were less aggressive than sellers. Ethereum funding remained strongly positive at +10.1% annualized, attracting traders seeking yield on long positions; its long/short ratio of 2.50 showed many more longs, and top traders were long at 1.67×. Market breadth was negative: only 36.5% of Binance perps were up on the day (288 of 789), signaling weakness across most coins.

Every term used today, in plain words

Annualized funding rate — The annual return (as a percentage) that traders pay or receive for holding leveraged positions on a perpetual futures contract. Positive rates mean long traders pay shorts; negative means shorts pay longs. Reflects market sentiment and leverage levels.

Breadth — The percentage of all coins trading up versus down on an exchange on a given day. High breadth (many coins up) signals broad bullish sentiment; low breadth (many coins down) signals weakness.

Funding rate — A small periodic payment between long and short traders on perpetual futures contracts, designed to keep the contract price close to the spot price. Paid every 8 hours on most exchanges.

Long/short ratio — The ratio of open contracts betting on price rises (longs) versus price falls (shorts). A ratio above 1.0 means more traders are long; below 1.0 means more are short.

Mark price — The exchange's calculated reference price for a perpetual futures contract, used to calculate gains/losses and to trigger liquidations. Different from the last traded price; designed to prevent manipulation.

Open interest — The total number of open long and short contracts (or the total dollar value of those contracts) on a perpetual futures exchange for a given coin pair.

Taker buy/sell ratio — The proportion of market-impact trades (those that fill existing orders) that were buys versus sells. A ratio above 1.0 means more aggressive buying; below 1.0 means more aggressive selling.

Top trader long/short ratio — The ratio of long to short positions held by the largest traders (whale accounts) on an exchange. Shows what the most influential traders are betting on.
