STRONG BEARISH

2026-11-05 00:00–23:59 UTC · all times UTC · data from Binance, Bybit, OKX, Bitget, Gate + Twelve Data

THE DAY IN ONE LINE

Bitcoin fell 5.5% and Ethereum fell 7.7% as a Wall Street selloff—dragging stocks down 4-5.5%—triggered $1 billion in crypto liquidations; only 9% of Binance perpetual contracts were up on the day.

02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 00:47 UTC), not daily figures.

Funding rates on BTC and ETH stayed high at 10.95% annualized on several venues—meaning long-position traders were paying shorts to hold those shorts, indicating overleverage before the crash. Open interest fell sharply: Binance BTC down 7.4%, Binance ETH down 9.4%, as liquidations forced traders to close positions. Long/short account ratios stayed elevated (BTC 1.39, ETH 1.83 on Binance), but the largest traders held even bigger long exposure (BTC top ratio 1.92, ETH top ratio 1.43), meaning they also got hurt. Taker buy/sell ratios stayed above 1 (BTC 1.06, ETH 1.06), suggesting some dip-buying despite the crash. Market breadth was severely bearish at just 9% of Binance perpetuals up and 91% down.

Asian equity markets collapsed in sympathy with the Wall Street selloff. Korea's KRX session saw SK Hynix fall 13.3%, Samsung Electronics drop 11.7%, and the broader KODEX 200 ETF fall 11%, driven by tech and semiconductor losses. Hong Kong saw steeper moves: the CSOP SK Hynix 2x leveraged fund crashed 23.2%, while Zhongji Innolight fell 14.1%. China's session was muted with Unitree Robotics down 0.1% and CXMT down 5.4%. The selloff reflected the same AI-spending concerns hitting US tech stocks: Nasdaq was down 5.5% and S&P 500 down 4.4%, dragging global equities lower.

THE THREE THAT MATTERED MOST

Bitcoin crashes below $76,000 as Wall Street selloff triggers $1 billion in liquidations

A sharp reversal on Wall Street—driven by concerns over excessive AI spending after the Democratic midterm sweep—spilled into crypto markets. The S&P 500 fell 4.4%, the Nasdaq fell 5.5% (its worst day in 18 months), and crypto followed. Bitcoin dropped to $75,880, Ethereum to $2,234. Leveraged traders holding long positions faced $1+ billion in forced closures.

07 · GLOSSARY

Every term used today, in plain words

Breadth — The percentage of all crypto perpetual contracts that were up on the day versus down. On 2026-11-05, only 9% were up and 91% were down, indicating extreme bearish pressure across the market.

Funding rate — The interest rate paid between long-position and short-position traders on a perpetual futures contract. A positive rate (like 10.95% annualized on this day) means longs are paying shorts; this happens when the market is very bullish and overlevered long. A high rate is often a sign of excessive confidence that can precede sharp corrections.

Liquidation — Forced closure of a trader's leveraged position when their account balance falls below the required margin. If a trader borrowed money to buy 10 Bitcoin and the price drops sharply, the exchange automatically sells their coins to recover the loan. Mass liquidations can amplify price declines.

Long position — A bet that the price will go up. If you own Bitcoin expecting it to rise, you are 'long' Bitcoin.

Long/short ratio — The ratio of long-position accounts to short-position accounts on an exchange. A ratio of 1.4 means there are 1.4 times more longs than shorts. High ratios (above 2) suggest excessive bullishness and higher risk of a sharp correction.

Mark price — The current fair-value price of a perpetual futures contract as calculated by the exchange, used to determine liquidations. It differs from the last trade price because it's a weighted average of recent trades and underlying spot prices to prevent manipulation.

Open interest — The total dollar amount of all open long and short positions on a perpetual futures contract at an exchange. When open interest falls sharply, it means traders are closing positions. When it rises, it means new leverage is entering the market.

Open-interest change — The percentage increase or decrease in the total dollar value of open positions over a time period (in this report, over the day). On 2026-11-05, Bitcoin open interest fell 7.4% on Binance, meaning billions of dollars in positions were closed or liquidated.

Short position — A bet that the price will go down. If you have borrowed Bitcoin and sold it, hoping to buy it back cheaper later, you are 'short' Bitcoin.

Taker buy/sell ratio — The ratio of aggressive buyer orders (takers) to aggressive seller orders on an exchange. A ratio above 1 means more buyers are hitting the ask price than sellers hitting the bid price, suggesting slightly bullish conviction. On 2026-11-05, the ratio stayed above 1 despite the crash, hinting at some dip-buying.

Top-position ratio — The long/short ratio specifically among the largest traders (those holding the biggest positions) on an exchange, separate from the ratio of all accounts. If this is much higher than the overall ratio, it means whales are more bullish than the crowd, which can be a risk signal if the market turns.
