02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 00:00 UTC), not daily figures.

Bitcoin's 8-hour funding rate was positive at 0.00006086 (6.66% annualized), suggesting traders with leverage still expected prices to rise, but open interest fell 1.83%, indicating they were closing or reducing bets. On Binance, the long/short ratio was 3.08 and the top traders' ratio was 1.87 (both favoring bets on price increases), yet the taker buy/sell ratio was 0.863—below 1.0 means aggressive selling pressure won out. Ethereum had negative funding rates (-9.18% annualized), meaning traders paid to hold short bets (bets on lower prices), but open interest still fell 2.22%. Market breadth collapsed: only 8.6% of Binance crypto futures were in profit on the day. The fear-and-greed index rose from 25 to 28, signaling increased worry.

Web3Auth says it frontran hackers by moving $5.6 million out of exposed Keplr wallets

A security breach in Keplr wallet infrastructure exposed user wallet information. Web3Auth said it acted quickly to move $5.6 million out of at-risk wallets before attackers could take them, though the company indicated some funds were stolen before the rescue.

Stablecoin growth has stalled. The payments boom hasn't.

Stablecoin supply (the total amount issued) barely grew this year, yet the number of transactions using stablecoins surged. Circle's latest earnings show the gap between dollars outstanding and actual payment activity is widening—payments are booming but the token supply isn't growing to match.

Vitalik Buterin says ETH should be valued as a store of value, not a fee-burning token

Ethereum's creator Vitalik Buterin proposed a significant shift in how Ethereum should be thought about: as a savings vehicle like Bitcoin rather than primarily as a token whose value comes from transaction fees. This represents a strategic pivot in Ethereum's narrative and long-term positioning.

The catch in recovering a hacked crypto wallet: the thief may still have a key

Even if a wallet is recovered and emptied of funds, the attacker may retain a private key to the wallet and can regain access later. Keplr's documented backup features help users reduce reliance on single login methods but cannot prove an exposed key is safe.

07 · GLOSSARY

CS Gorkem T
CS Tarik O

Every term used today, in plain words

Annualized percentage (for funding rates) — A funding rate stated as if it continued for a full year. An 8-hour funding rate of 0.00006 annualizes to 6.66% because there are 1,095 such intervals in a year (365 days × 3 per day).

Breadth — The percentage of all trading pairs (cryptocurrencies) that went up in price during the day. Low breadth (like 9%) means most coins fell; high breadth means most rose. Shows whether a move is broad-based or driven by a few coins.

Fear-and-greed index — A number from 0 to 100 measuring trader emotion. 0–25 is extreme fear, 25–45 is fear, 45–55 is neutral, 55–75 is greed, 75–100 is extreme greed. Higher numbers mean traders expect prices to rise; lower numbers mean they expect them to fall.

Funding rate — A payment between traders betting prices go up (longs) and traders betting prices go down (shorts). Positive rates mean longs pay shorts; negative rates mean shorts pay longs. Reflects whether traders expect prices to rise or fall.

Long / long position — A bet that a cryptocurrency's price will go up. If a trader is 'long' Bitcoin, they own it or are using leverage to amplify an ownership position.

Long/short ratio — The number of traders betting on price increases (longs) divided by the number betting on price decreases (shorts). A ratio above 1.0 means more longs; below 1.0 means more shorts.

Mark price — The reference price used to calculate funding payments and margin requirements on a leveraged trading exchange. Usually close to the real-time market price but may differ slightly.

Open interest — The total amount of cryptocurrency (in coins or USD value) that traders have borrowed to take leveraged positions. High open interest means many leveraged bets are outstanding; low open interest means fewer. When open interest falls, traders are closing positions.

Open-interest change — How much the total open interest grew or shrank during the day. A decline usually means traders reduced leverage, either because they closed winning bets or cut losses.

Short / short position — A bet that a cryptocurrency's price will go down. A trader using leverage to short Bitcoin expects the price to fall and profits if it does.

Taker buy/sell ratio — A measure of aggressive trading direction. Takers are traders buying or selling immediately at market price. A ratio of 0.863 means for every $0.863 of aggressive buying, there was $1.00 of aggressive selling. Below 1.0 indicates net selling pressure.

Top trader position ratio — Among the largest traders on an exchange, the ratio of those betting on price increases (longs) to those betting on price decreases (shorts). Shows which direction the biggest players are positioned. A ratio of 1.87 means the largest traders are heavily betting on price increases.
