All five major venues (Binance, Bybit, OKX, Bitget, Gate) quoted virtually identical prices for Bitcoin and Ethereum—within \$30–50 per coin—showing traders agreed on fair value. Binance dominated volume, trading \$11.8 billion in BTC futures and \$10.6 billion in ETH futures, with the other four venues combined handling roughly similar size.

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way.

Traders were decidedly bullish. Bitcoin's long-to-short ratio was 1.53 on Binance, meaning over 1.5 traders bet on up for every 1 betting down; Ethereum's was even more skewed at 3.2 to 1. Funding rates (the daily cost to hold leveraged positions) stayed positive across all venues, ranging from 2.5% to nearly 11% annually, indicating sustained bullish positioning. Open interest was mixed: Bybit saw 1.25% decline while Binance grew 1.16%, suggesting some traders closed longs but new money entered elsewhere.

THE THREE THAT MATTERED MOST

Federal Reserve raises interest rates 0.25% to 3.75%–4.00%, first hike since July 2023

The US Federal Reserve voted to increase its benchmark interest rate by 0.25 percentage points (25 basis points) to a range of 3.75%–4.00%. This is the first rate increase in over three years. Fed officials signaled that more increases may come, though they may slow the pace. A rate hike typically increases borrowing costs for consumers and businesses, which can reduce economic activity.

07 · GLOSSARY

Every term used today, in plain words

Basis point — One-hundredth of a percent (0.01%). Used to describe small changes in interest rates or percentages. A 0.25% rate increase equals 25 basis points.

Bitcoin — The first and largest cryptocurrency by market value. It is a digital currency that runs on a network of computers and records transactions on a public ledger called blockchain.

ETF (exchange-traded fund) — A fund that tracks the price of an asset (like Bitcoin or gold) and trades on regular stock exchanges. Investors can buy and sell ETF shares like stocks.

Ethereum — A blockchain network and its associated cryptocurrency. It enables programmable applications and smart contracts on top of a public ledger, similar to Bitcoin but more flexible.

Funding rate — A fee that traders with leveraged positions pay to each other every few hours (often 8 hours on crypto exchanges). When funding rates are positive, traders betting on price increases pay those betting on decreases. High positive rates signal bullish sentiment; high negative rates signal bearish sentiment.

Leveraged position — A bet placed with borrowed money, allowing a trader to control a larger amount than they deposited. For example, 10x leverage means controlling \$10,000 worth of Bitcoin while depositing only \$1,000. Leverage amplifies both gains and losses.

Long/short ratio — A comparison of how many traders are betting on price increases (long) versus price decreases (short). A ratio of 1.53 means 1.53 traders are long for every 1 trader short. Higher ratios indicate bullish sentiment.

Mark price — The current fair-value price of a futures contract, calculated by exchanges using the spot price plus a funding adjustment. It is used to decide if a leveraged position should be forcibly closed (liquidated).

Open interest — The total number of leveraged positions (long and short bets combined) currently open on an exchange. Rising open interest suggests new money entering; falling open interest suggests traders closing positions.

Venue — A crypto exchange or trading platform where futures contracts are bought and sold. In this report, venues include Binance, Bybit, OKX, Bitget, and Gate.
