02 · POSITIONING

How traders were leaning

Funding shows which side is paying to hold its position (positive = longs pay shorts). Open interest is how much money is in open bets; its change over the day shows money coming in or out. Long/short is how many accounts lean each way. Top L/S is the ratio among the largest traders. Taker B/S is the buy-to-sell ratio of market orders.

Funding, open interest and mark price are point-in-time (as of 10:00 UTC), not daily figures.

Bitcoin open interest surged +4.68%, signaling fresh leverage entered the market, while long/short positioning favored buyers at 1.50 to 1 overall and 1.84 to 1 among the largest traders. Ethereum open interest actually declined −0.55% despite a heavier long skew at 2.74 to 1. Funding rates diverged sharply: Binance charged shorts (−1.48%), Bybit charged shorts harder (−3.28%), but Bitget and Gate paid longs heavily (+10.95%), suggesting imbalanced positioning and arbitrage opportunities. Taker activity showed slight buying pressure on both (Bitcoin 1.02, Ethereum 1.03 buy/sell ratio). Market breadth was severely depressed—only 16% of Binance perps closed higher, indicating broad weakness beneath the major coins.

Asian equity markets showed stark conflict: the actual Korean cash market (KRX) surged sharply with Samsung Electronics +5.67% and SK Hynix +5.81% on strong semiconductor export data, yet the corresponding Binance stock perps tracking these equities fell significantly (SK Hynix perp −4.94%, Samsung −4.08%), suggesting the perps may be using different reference pricing or lagging the spot market. Hong Kong tech stocks declined sharply (Zhipu AI −7.89%, GigaDevice −8.34%, Tencent −3.78%). US semiconductor and tech shares weakened further (Intel −11.34%, Lam Research −10.73%). Precious metals and commodities sold off broadly (gold −0.76%, silver −2.35%, copper −1.63%), typical of risk-off sentiment across traditional markets.

THE THREE THAT MATTERED MOST

Solana activates Alpenglow consensus upgrade, cutting transaction finality to 150 milliseconds

Solana mainnet activated Alpenglow on October 21 at epoch 1064, replacing its TowerBFT consensus with a new Votor protocol. The upgrade cuts the time for transactions to become irreversible from approximately 12.8 seconds to about 150 milliseconds—roughly 99% faster. Validators now send votes directly to each other instead of recording them on-chain, bundling them into aggregate certificates and finalizing blocks in one or two rounds.

Tesla and SpaceX form merger committees; combined entity would hold 30,221 Bitcoin

Independent directors at both companies announced they are evaluating a potential merger following comments from Elon Musk during SpaceX's Q3 earnings call on October 20. The tie-up would combine Tesla's 11,509 BTC and SpaceX's 18,712 BTC into a single treasury holding ~$2.5 billion worth of Bitcoin (at $83k/BTC), making the merged entity a top-six public corporate Bitcoin holder by count.

OCC finalizes GENIUS Act stablecoin rule; banking groups object to yield loopholes

The Office of the Comptroller of the Currency published final regulations implementing the GENIUS stablecoin act, setting federal standards for reserves, redemptions, custody, capital and audits effective January 18, 2027. The American Bankers Association criticized the final rule for preserving crypto platforms' ability to offer stablecoin yield, arguing the OCC removed safeguards against indirect yield arrangements through affiliates and distribution partners, undermining Congress's intent to protect bank deposits.

07 · GLOSSARY

CS Gorkem T
CS Tarik O

Every term used today, in plain words

basis — The reporting period for price and volume data; 'utc-day' means the price change is measured over the UTC calendar day (00:00–23:59 UTC)

breadth — The percentage of all crypto assets that moved up versus down; low breadth (e.g., 16% up) shows weakness is broad, not concentrated in a few coins

Fear & Greed Index — A sentiment measure ranging from 0 (Extreme Fear) to 100 (Extreme Greed) based on market volatility, social volume, and other inputs; helps show whether traders are optimistic or scared

funding rate — A periodic payment between long and short traders on a futures contract, used to keep the perpetual price close to the spot price; positive rates mean longs pay shorts, negative rates mean shorts pay longs

funding rate (annualized) — The funding rate scaled to an annual percentage for easier comparison; for example, 10.95% annualized means that if you held a long position for a full year and rates stayed constant, you would pay 10.95% of your notional position in funding

long/short ratio — The ratio of open positions betting the price will rise (longs) versus fall (shorts); a ratio above 1 means more traders are long, below 1 means more are short

mark price — The reference price used for liquidations and funding calculations on a futures contract, designed to prevent manipulation and stay close to the spot price

net inflow (ETF) — The dollar amount of new money flowing into an exchange-traded fund minus redemptions; positive numbers show more buying than selling by institutions

open interest — The total amount of money or coins locked into outstanding futures contracts on an exchange; rising open interest suggests increasing leverage and conviction, falling suggests positions are being closed

open-interest change — The percentage increase or decrease in total open interest over the reporting period; positive change means traders are opening new positions or adding to existing ones, negative means they are closing or reducing

taker buy/sell ratio — The ratio of aggressive market orders to buy versus sell; a ratio above 1 means more buyers are hitting the ask (buying eagerly), below 1 means more sellers are hitting the bid (selling eagerly)

top position ratio — The long/short balance among the largest traders only (not all accounts); used to see whether the 'smart money' is more bullish or bearish than the crowd
